QA PROJECT SUBMISSION

Bug Report Starter Pack

Defect Reporting & Evidence Documentation

Prepared by	Maryam Masood
Project title	Bug Report Starter Pack
Registration number	OCT26-SQ06-01
Submission date	4 November 2026
Assignment deadline	3 Days

Training project • Fictional defect scenarios • Practical screenshots supplied with the assignment

1. Project Overview

This starter pack demonstrates a consistent, professional approach to reporting software defects. It contains four fictional defect reports, a shared test environment, reproducible steps, expected and actual results, severity and priority assessments, and evidence placeholders. The practical screenshots supplied with the assignment are included in the evidence appendix.

Important training note: All four defects below are fictional examples created for learning. They have not been confirmed in a live application. The attached practical screenshots show shopping-site testing steps; they are included as practical-work evidence and are not presented as proof that the fictional defects occurred.

Project objectives

• Practice writing concise, reproducible defect reports.

• Separate severity (impact) from priority (urgency).

• Record the environment and exact steps needed to reproduce an issue.

• Capture expected versus actual behaviour and identify evidence still required.

• Maintain traceability between a defect ID and its supporting screenshot or recording.

2. Scope & Test Flow

The example test flow represents a basic e-commerce journey: open the site, sign in, review the shopping cart, update or remove an item, continue to checkout, and review payment details. The uploaded practical evidence contains screenshots of login, cart, checkout and payment-related screens.

In scope

• Login form validation and feedback

• Shopping-cart quantity and item-removal behaviour

• Cart badge/count consistency

• Checkout/payment required-field validation

Out of scope

Live payment processing, real customer data, production transactions, security penetration testing, and actual defect confirmation are outside this training pack.

3. Test Environment

Attribute	Training value
Application	Fictional e-commerce web application (training scenario)
Environment	QA / Staging (assumed for fictional reports)
Build	1.0.0 (illustrative)
Browser	Google Chrome – latest stable (version to be recorded during execution)
Operating system	Windows 11 (64-bit)
Device / viewport	Desktop; 1366 × 768 pixels
Test data	Dummy account and non-production cart/payment data only
Network	Stable internet connection (assumed)

Environment note: the browser version, build number, test URL and execution date/time must be replaced with the actual values when these test cases are run. Do not use real card or personal information.

4. Severity & Priority Guide

Level	Meaning	Example
Critical	System-wide failure, data loss, or major business/security impact; no reasonable workaround.	Checkout or core service completely unavailable.
High	Major feature broken or incorrect; significant user impact; workaround limited.	User cannot complete a purchase.
Medium	Feature works incorrectly but a workaround exists; limited impact.	Cart total refreshes only after reload.
Low	Minor visual, wording, or usability issue with little functional impact.	Misaligned label or typo.

Priority guide: P1 = fix immediately / next urgent release; P2 = fix in the planned near-term release; P3 = schedule when capacity allows. Priority can change after product-owner review.

5. Defect Summary

Defect ID	Short description	Severity	Priority	Status
BR-001	Invalid login feedback is unclear	Medium	P2	New – fictional
BR-002	Cart subtotal does not update immediately	High	P1	New – fictional
BR-003	Cart badge remains stale after item removal	Medium	P2	New – fictional
BR-004	Checkout continues with required billing fields blank	High	P1	New – fictional

6. Defect Report – BR-001

Login form displays unclear feedback for invalid credentials

Field	Details
Defect ID	BR-001
Module	Login / Authentication
Defect type	Functional / Usability
Severity	Medium
Priority	P2
Status	New – fictional training example; not verified
Environment	QA/Staging • Chrome • Windows 11 • Desktop 1366 × 768 • Build 1.0.0 (assumed)
Preconditions	User is on the login page. A registered test username and an intentionally incorrect password are available.

Steps to Reproduce

1. Open the application login page.
2. Enter a valid test username/email.
3. Enter an incorrect password.
4. Select the Sign in / Login button.
5. Observe the message displayed below or near the form.

Expected Result

The application should display a clear, user-friendly message such as “Email or password is incorrect” and keep the user on the login page. The message should not reveal whether the account exists.

Actual Result

Fictional example: the page displays only a generic “Error” message with no useful explanation or field-level guidance.

User / Business Impact

The user may not understand how to correct the sign-in attempt, increasing confusion and support requests.

Evidence Placeholder

Placeholder: attach a screenshot showing the submitted invalid credentials with all passwords masked, plus the resulting error message. Suggested filename: BR-001_Login_Error.png.

SCREENSHOT / RECORDING TO BE ATTACHED HERE

Defect ID: BR-001
Capture date/time: _____
File name / link: _____
Tester notes: _____

Re-test note: after a fix is delivered, repeat the same steps on the stated build, verify the expected result, attach fresh evidence, and update the defect status (Fixed → Retest → Closed, or Reopened if it still fails).

6. Defect Report – BR-002

Cart subtotal does not refresh immediately after quantity change

Field	Details
Defect ID	BR-002
Module	Shopping Cart
Defect type	Functional / Calculation
Severity	High
Priority	P1
Status	New – fictional training example; not verified
Environment	QA/Staging • Chrome • Windows 11 • Desktop 1366 × 768 • Build 1.0.0 (assumed)
Preconditions	At least one in-stock product is present in the cart. Use a non-production test account and note the displayed unit price.

Steps to Reproduce

1. Open the shopping cart.
2. Record the current item quantity, unit price and subtotal.
3. Increase the quantity from 1 to 2 using the quantity control.
4. Wait for the cart update to complete.
5. Observe the line total and order subtotal without refreshing the page.

Expected Result

The line total and order subtotal should update immediately and accurately to reflect the new quantity. The updated quantity should remain visible.

Actual Result

Fictional example: the quantity changes to 2, but the line total and subtotal continue to show the previous amount until the page is refreshed.

User / Business Impact

The customer may make a purchase decision using an incorrect displayed total. This affects a core cart calculation.

Evidence Placeholder

Placeholder: attach before-and-after screenshots showing quantity, unit price, line total and subtotal. Suggested filename: BR-002_Cart_Subtotal.png.

SCREENSHOT / RECORDING TO BE ATTACHED HERE

Defect ID: BR-002
Capture date/time: _____
File name / link: _____
Tester notes: _____

Re-test note: after a fix is delivered, repeat the same steps on the stated build, verify the expected result, attach fresh evidence, and update the defect status (Fixed → Retest → Closed, or Reopened if it still fails).

6. Defect Report – BR-003

Cart badge count remains unchanged after removing an item

Field	Details
Defect ID	BR-003
Module	Shopping Cart / Header
Defect type	UI State / Functional
Severity	Medium
Priority	P2
Status	New – fictional training example; not verified
Environment	QA/Staging • Chrome • Windows 11 • Desktop 1366 × 768 • Build 1.0.0 (assumed)
Preconditions	The cart contains at least two different products and the header cart badge displays the current item count.

Steps to Reproduce

1. Open the shopping cart and note the header cart badge count.
2. Remove one product using its Remove/Delete control.
3. Wait for the cart contents to refresh.
4. Check the remaining cart items and the header badge count.
5. Navigate to another page and check the badge again.

Expected Result

The removed product should disappear from the cart, and the header badge should update to match the remaining cart quantity/count consistently across pages.

Actual Result

Fictional example: the product is removed from the cart list, but the header badge continues to show the old count until a full page refresh.

User / Business Impact

The cart summary appears inconsistent and may cause users to doubt whether the item was removed successfully.

Evidence Placeholder

Placeholder: attach screenshots before and after removal, including the header badge and cart contents. Suggested filename: BR-003_Cart_Badge.png.

SCREENSHOT / RECORDING TO BE ATTACHED HERE

Defect ID: BR-003
Capture date/time: _____
File name / link: _____
Tester notes: _____

Re-test note: after a fix is delivered, repeat the same steps on the stated build, verify the expected result, attach fresh evidence, and update the defect status (Fixed → Retest → Closed, or Reopened if it still fails).

6. Defect Report – BR-004

Checkout proceeds when required billing fields are empty

Field	Details
Defect ID	BR-004
Module	Checkout / Billing Details
Defect type	Validation / Functional
Severity	High
Priority	P1
Status	New – fictional training example; not verified
Environment	QA/Staging • Chrome • Windows 11 • Desktop 1366 × 768 • Build 1.0.0 (assumed)
Preconditions	A product is in the cart and the user has reached the checkout billing-details form. Use dummy data only; do not submit a real payment.

Steps to Reproduce

1. Proceed from the cart to checkout.
2. Leave one or more mandatory billing fields empty (for example, full name or address).
3. Select Continue / Proceed to Payment.
4. Observe validation messages and whether the next checkout step opens.

Expected Result

The form should block progression and identify each missing required field with clear, accessible validation messages. No payment step should be initiated.

Actual Result

Fictional example: the application advances to the next checkout step even though mandatory billing fields are blank.

User / Business Impact

Incomplete customer/order information may be submitted, disrupting fulfilment and creating downstream errors.

Evidence Placeholder

Placeholder: attach a screenshot of the blank required fields and the resulting next-step screen or validation state. Suggested filename: BR-004_Checkout_Validation.png.

SCREENSHOT / RECORDING TO BE ATTACHED HERE

Defect ID: BR-004
Capture date/time: _____
File name / link: _____
Tester notes: _____

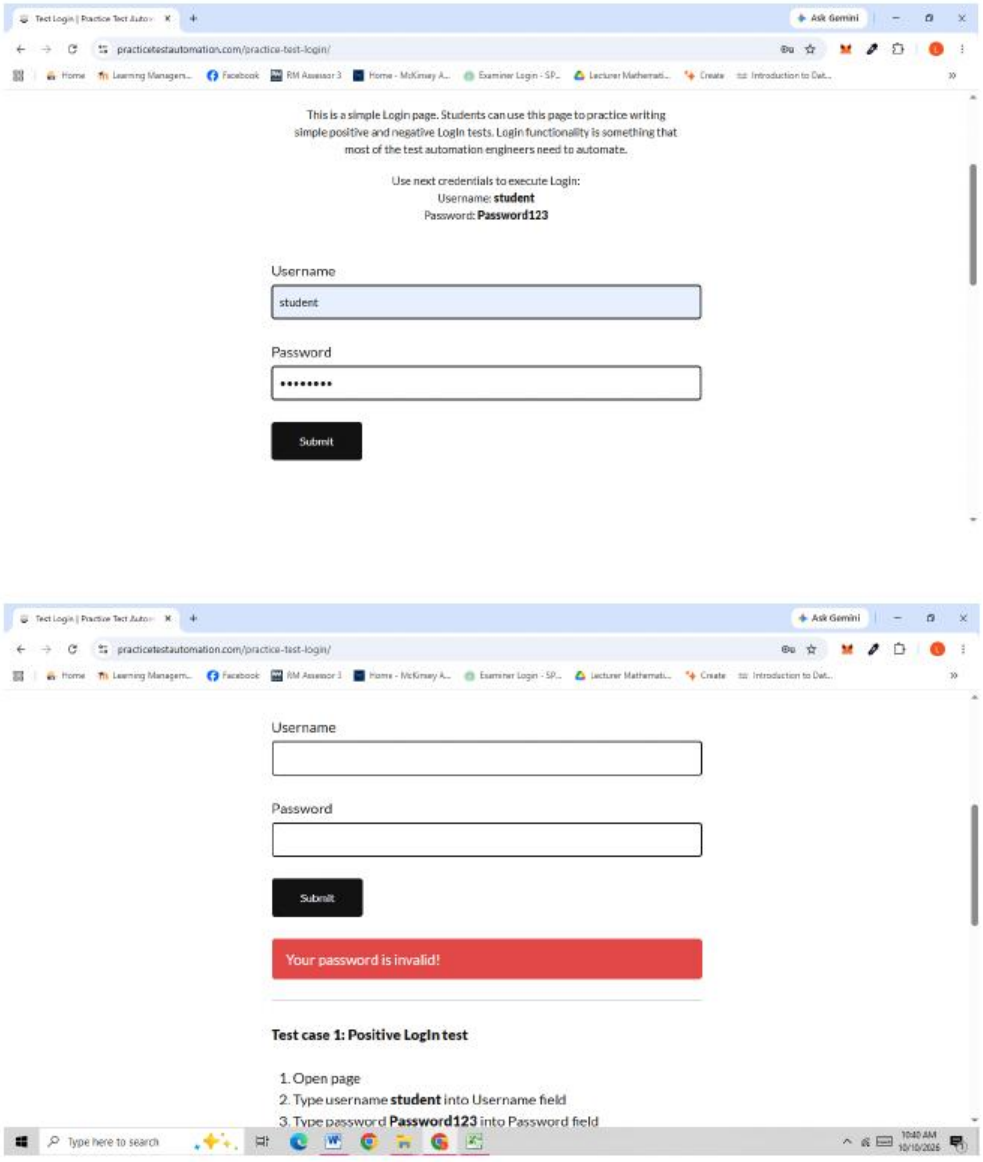

Re-test note: after a fix is delivered, repeat the same steps on the stated build, verify the expected result, attach fresh evidence, and update the defect status (Fixed → Retest → Closed, or Reopened if it still fails).

7. Practical Screenshot Evidence

The following five screenshots are reproduced from the PDF supplied with this assignment. They document practical work through login, cart and checkout/payment screens. They are not evidence that the four fictional defects above were observed. Add the actual test date, browser version and result notes if known.

Practical Screenshot 1

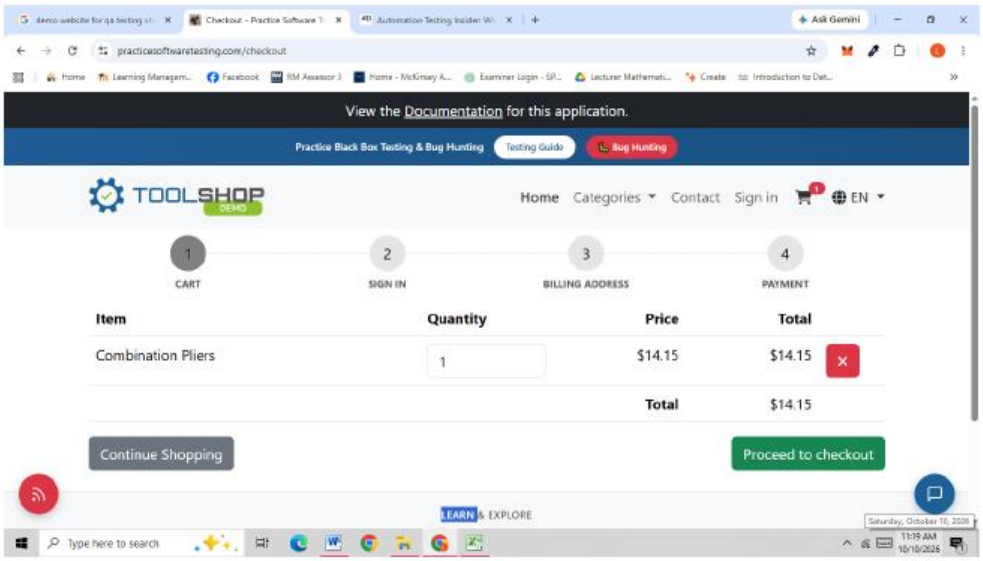

Evidence A – Login screen / sign-in form shown in the supplied practical work.

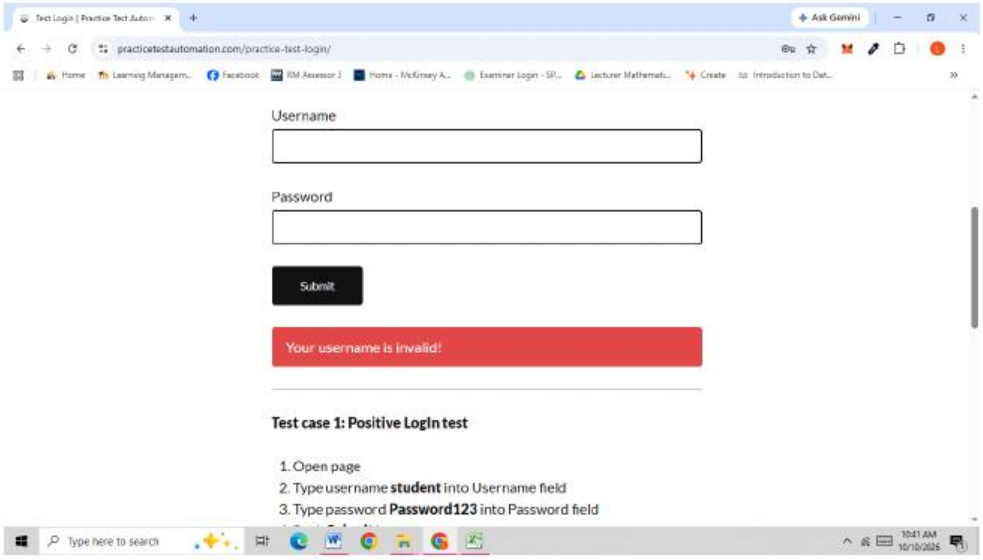

Source: user-provided “screen shots of practices assignment 2.pdf”. Screenshot is included as supplied; no claim is made that it proves a listed fictional defect.

Practical Screenshot 2

Evidence B – Shopping cart view showing a product and cart controls.

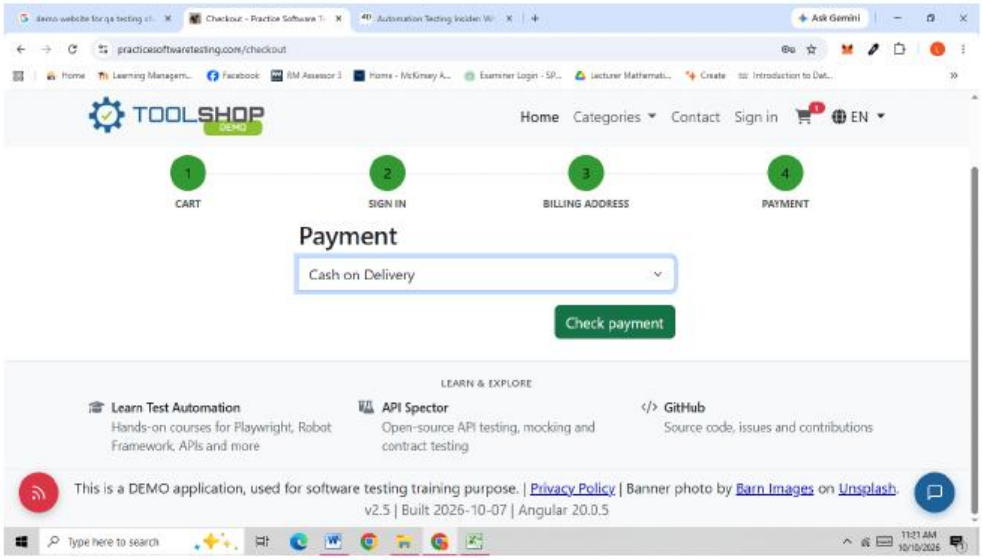

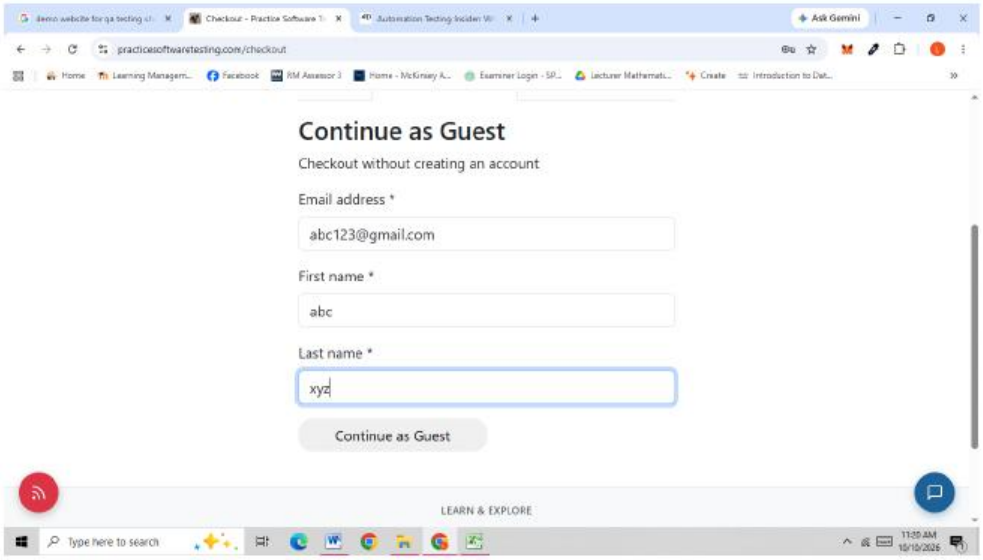

Source: user-provided “screen shots of practices assignment 2.pdf”. Screenshot is included as supplied; no claim is made that it proves a listed fictional defect.

Practical Screenshot 3

Evidence C – Checkout/payment-related screen from the supplied practical work.

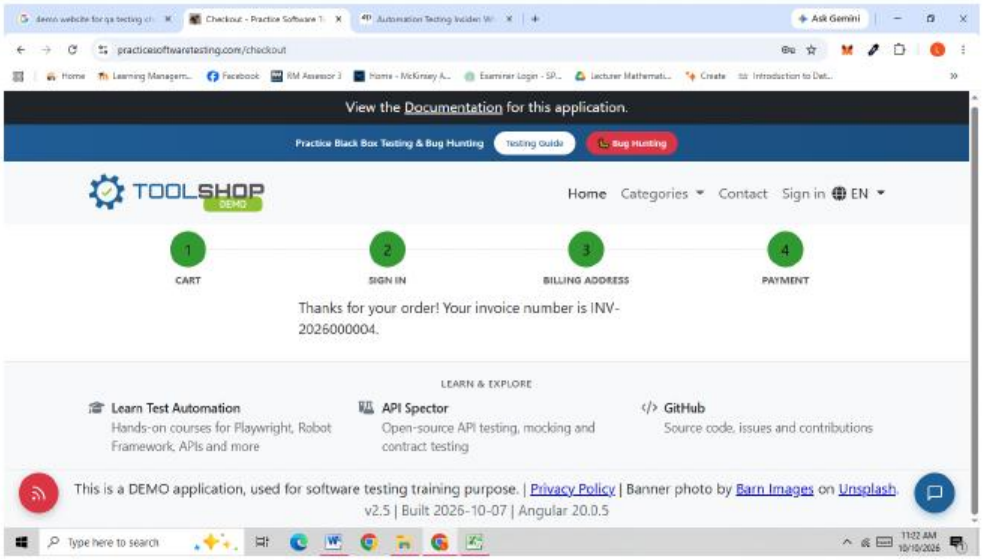

Source: user-provided “screen shots of practices assignment 2.pdf”. Screenshot is included as supplied; no claim is made that it proves a listed fictional defect.

Practical Screenshot 4

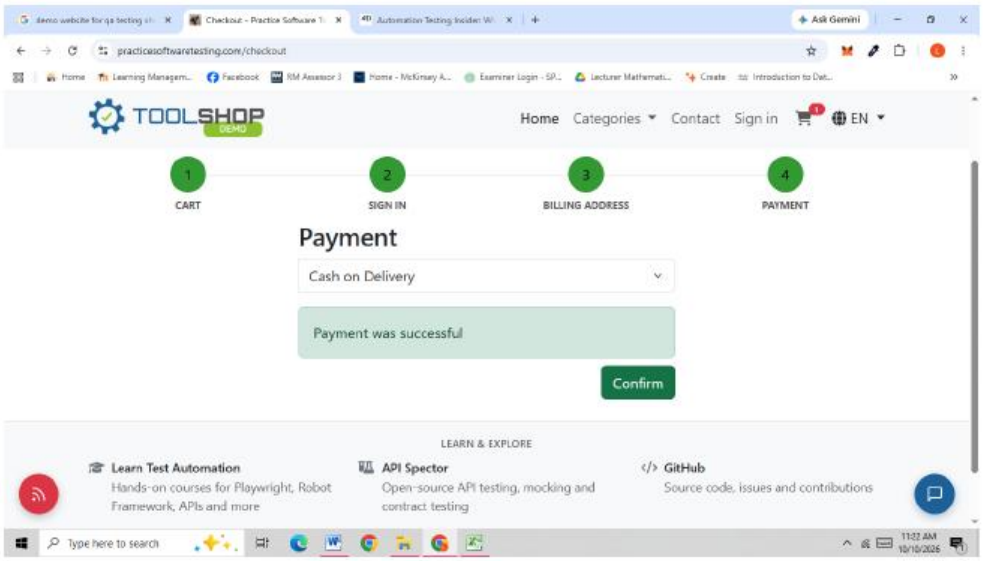

Evidence D – Cart / checkout flow screen captured during the supplied practical work.

Source: user-provided “screen shots of practices assignment 2.pdf”. Screenshot is included as supplied; no claim is made that it proves a listed fictional defect.

Practical Screenshot 5

Evidence E – Payment screen from the supplied practical work.

Source: user-provided “screen shots of practices assignment 2.pdf”. Screenshot is included as supplied; no claim is made that it proves a listed fictional defect.

8. Submission Checklist

• Cover page includes name, project title, date and registration number.

• Four fictional defect reports are included with unique IDs.

• Each report includes environment, preconditions and numbered reproduction steps.

• Expected and actual results are clearly separated.

• Severity and priority are assigned with a short rationale in the impact statement.

• An evidence placeholder and suggested screenshot filename are provided for every defect.

• Five practical screenshots from the supplied PDF are included in the appendix.

• Fictional examples and supplied practical evidence are clearly distinguished.

• Before claiming a real defect, execute the steps, capture fresh evidence and update the report.

9. Final Notes

This document is a ready-to-submit training pack. The four defect scenarios are fictional by design, while the appendix contains the practical screenshots supplied for this assignment. To convert the examples into verified defect reports, run each scenario on the actual application, record the exact URL/build/browser version, capture the observed result, and replace the evidence placeholders with genuine screenshots or a short recording.
